

Phase 1 — adaptive SVD compression of the random-ray adjoint flux
real slab, 1-group water at 1 MeV, 200x8000 mortal rays. Voxels physically meaningful (smallest edge $\geq \text{mfp}/8 \sim 1.8 \text{ cm}$).

Compression ratio (numbers = SVD rank, D = dense)

Reconstruction error (dotted = tolerance)

On-disk storage (dense vs adaptive picker)
